                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ56889 - ABZ65216, ABZ65531, ABZ65520 - ABZ65524, ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HBR2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K.Ras, H.Ras, N.Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K.Ras, H.Ras, and HIV activity in a cell. The nucleic acid stream the same useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABES9899 - ABES6216, ABE65531, ABE66520 - ABE66524, riboszymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Bnhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver fallure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                     Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                            amberzyme; G-cleaver ribozyme; decoy molecule; aptamer;
HBV reverse transcriptaes; Enhancer I region; viral replication;
degenerative; disease state; HBV infection; HCV infection; cirrhosis;
liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;
             minus strand DNAzyme substrate sequence #1478.
                                                                                                                                 virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                 26-MAR-2001; 2001US-00817879.

 The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, DNAzymes, or nozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or halso disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV binazyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                      Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                     ä

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, amberzymes, amberzymes, and G-cleaver ribozymes, Also disclosed are nucleic acid decoy molecules and G-cleaver ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligomucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene archivesion such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represente a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
and enzymatic nucleic acids such as hammerhead ribozymes. DNAzymes,
c inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
are nucleic acid decoy molecules and aptamers that bind to HBV reverse
transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
C as oligonucleotides that specifically bind the Enhancer I region of HBV
C as oligonucleotides that specifically bind the Enhancer I region of HBV
C as oligonucleotides that specifically bind the Enhancer I region of HBV
C and of the invention are used to modulate the expression of HBV
c hat modulate the expression and/or replication of HCV. The compounds
methods of the invention are useful for the treatment of degenerative and
disease states related to HBV and HCV infection, replication and gene
expression such as cirrhosis, liver failure, and hepatocellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                           Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lee P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mcswiggen J, Morrissey D, Pavco P,
                                                                                                                                                                                                          HCV minus strand DNAzyme substrate sequence #1362.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page 299; 387pp; English.

ö
carcinoma. The present sequence represents a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Heparitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus

ö
inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HV. The compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gen expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to human phenotype-associated (PA) genes (I ; Appl3307-AbF13386) which contain a Single Nuclectide Polymorphism (SNP). The SNP is given in the sequence as a variant nucleotide. Also claimed are methods for screening for agents which regulate the activity of a PA gene and reagents that modulate the activity of a PA purclectide where the reagent is identified by the screening methods. The methods and compositions of the present invention are useful for prognosticating, diagnosing and treating cardiovascular diseases. Mypercential, hypertension, restenosis, arterial inflammation, used in the examples from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cardiant; antiarteriosclerotic; vasotropic; cerebroprotective;

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitinflammatory servoid and ubiquinone. A composition of the invention has antiinflammatory storaid and upiquinone, a composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing benefitivity to adenosine, reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fib. wipo.int/pub/published_pct_sequences

The invention comprises nucleic acids (e.g. antisense oligonucleotides)

that down regulate the expression or inhibit the function of a receptor

for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),

KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

invention are useful for treating; cerebrovascular accident, central

nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,

Imphoma or glioma), inflammatory disease (e.g. rhemmatoid arthritis,

restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

disease, lupus, multiple sclerosis, transplant/graft rejection,

ischemeia/reperfusion injury, glomerulonephritis, sepsis, and allergic

conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

nucleic acids of the invention are also useful for down-regulating the

cypression of a target gene and as a diagnostic tool to examine genetic

drifts and mutations within diseased cells or to detect the presence of a

target RNA in a cell. The present RNA sequence represents a human IKK-

gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR, cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergic rhinitis; atopic dermatitis; Human IKK-gamma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)

that down regulate the expression or inhibit the function of a receptor

for a neurite growth inhibitor, NOGO, prostaglandin Dz receptor (PTGDR),

KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the

invention are useful for treating: cerebrovascular accident, central

nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,

lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,

restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune

ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic

conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The

nucleic acids of the invention are also useful for down-regulating the

expression of a target gene and as a diagnostic tool to examine genetic

drifts and mutations within diseased cells or to detect the presence of a

charget RNA in a cell. The present RNA sequence represents a human PKR

that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR),
Ikappa kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,
Ikappa or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
is schemnia/reperfusion injury, glomearilonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermaticis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human PKR
substrate sequence.

that down regulate the expression or inhibit the function of a receptor that down regulate the expression or inhibit the function of a receptor (PTGDR).

IkappaB kinase (IKK), or protein kinase PRR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhintis or atopic dermattitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine general carget RNA in a cell. The present RNA sequence represents a human NOGO receptor amberzyme substrate sequence.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (FYGDR),
IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
Iymphoma or glioma), inflammatory disease (e.g. rheumatorid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischammia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restennsis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepais; allergy; asthma; allergic rhinitis; atopic dermatitis; Human IKK-gamma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, and expression vector comprising a nucleic acid sequences (encoding at least the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

                                                                                                                                                                                                                                               용
                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung alrway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated

(M1) involves detecting an expression product of at least one gene (II) in a first brain tissue sample (T7) suspected of being neoplastic, where (1) is chosen from any one of 255 genes (glioma endothelial markers (GEMs)) as given in specification, and comparing the expression of (I) in (T) with expression of (I) in second normal brain tissue sample (R), where increased expression of (I) in (T) relative to (R), identifies (T) as likely to be neoplastic. Also described: (1) treating (M2) glioma involves contacting cells of the glioma with an antibody that specifically binds to a extracellular epitope; (2) identifying (M3) a test compound as potential anticancer or antiglioma drug involves contacting a test compound with the cell which expresses
inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emplysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing glioma by detecting expression product of any one of 255 genes, glioma endothelial markers, in brain tissue sample suspected of being neoplastic, and comparing the expression with expression in normal

Disclosure, SEQ ID NO 1053; 122pp; English.

The invention relates to an enzymatic nucleic acid molecule that percifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, either alone or in combination with other theraples such as lamivudine and interferons. The mucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of a cell, for the study of RNA and for down-regulating gene expression of sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.

dentifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) a test compound as a potential anticancer or antiglioma drug involves contacting a test compound at particular anticancer or antiglioma drug involves contacting a test compound with the cell which expresses mRNA of at least one gene identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing MNS of the gene, and identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) and immune response to glioma involves administering to a mammal, a protein or (1). (1) have cytostatic activities, and can be used to trigger immune destruction of glioma cells, and as immune response inducers. (M1) is useful for aiding in diagnosing glioma. (M2) is useful for treating multiple of dipma in a human. (M5) is useful for inducing an immune response to a glioma in a human. (M5) is useful for inducing an immune response to a glioma in a mammal having glioma or in a mammal who has had a glioma surgically removed. The present sequence represents a human GEM contact.

```
Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I

       셤
```

Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                             Gaps

from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                          The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
Enzymatic nucleic acid molecules which specifically cleave RNA derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ss; enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV;

                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                        Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                        The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mutant cell identification-related mutagenic oligonucleotide SeqID752.

This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with an acid production as well as for use in mammalian cell lines.
                                                                                                                                                                                                             Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a selectable phenotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mutant cell identification-related mutagenic oligonucleotide SeqID751.

                                                                                                                             This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with altered amino acid production as well as for use in mammalian cell lines. The present sequence is that of a mutagenic oligonucleotide which was
Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selecting an animal for desired genotypic or potential phenotypic properties such as muscle mass and/or fat deposition, comprises testing for a single nucleotide polymorphism in intron 3 of the IGF2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Anorectic; Antidiabetic; Muscular; Gene Therapy; CpG island; IGF2 gene intron 3; muscle mass; fat deposition; teat number; obesity; muscle deficiency; diabetes; SNP; single nucleotide polymorphism; ss.

The present invention relates to a method (M1) for selecting an animal for having desired genotypic or potential phenotypic properties. (M1) comprises testing the animal for the presence of a nucleic acid modification affecting: the activity of an evolutionary conserved CpG island located in intron 3 of an IGF2 gene; and/or binding of a nuclear factor to an IGF2 gene. The nuclear factor is capable of binding to a stretch of nucleotides which in the wild type pig, mouse or human IGF2 gene is part of an evolutionary conserved CpG island, located in intron 3 of the IGF2 gene. The stretch is functionally equivalent to (ADQ80709). The nucleic acid modification in ADQ80709 comprises a G to A translition at IGF2-intron3-nt3072. (M1) is useful for selecting an animal with properties related to muscle mass, fat deposition, and/or test number. CC Also claimed is a method (M2) for modulating mRNA transcription of an IGF2 gene and an embod of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene. Also claimed is a method (M3) for identifying a compound capable of modulating mRNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating a porcine sequence tagged sites (STS) compromes capable of modulating a porcine sequence tagged sites (STS) comprising a boreity. Muscle deficiencies and diabetes. The present sequence is a porcine sequence tagged sites (STS) compressing an engagence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Endocrine, Antiseborrheic, Dermatological; Depilatory; RNA interference;

                                                                                                                                                                                                                 The present invention relates to novel small interfering RNAs (siRNAs), comprising a double stranded RNA, where one strand comprises a partial nucleic acid sequence of an androgen signal transduction pathway protein, and where the double-stranded RNA inhibits translation of mRNA encoding the nucleic acid sequence of the androgen signal transduction pathway protein thereby blocking the androgen signal transduction pathway. The androgen signal transduction pathway protein is chosen from isozymes I androgen signal transduction pathway protein is chosen from isozymes I creceptor (ADQ92571), aromatase (ADQ92856), 3-beta-hydroxysteroiddehydrogenase (ADQ932896), 3-beta-hydroxysteroiddehydrogenase (ADQ93182), and steroid sulfatase hydroxysteroiddehydrogenase (ADQ93182), and steroid sulfatase hydroxysteroiddehydrogenase (ADQ93720), and steroid sulfatase hydroxysteroiddehydrogenase (ADQ93722), and steroid sulfatase (ADQ93770). The siRNAs of the invention are useful for reducing hair loss in a mammal which involves contacting several mammal shair calls with the translation of mRNA of the siRNA, where the siRNA interferes with the translation of mRNA of the androgen signal transduction protein. The siRNAs are useful for treating and peaced and account of the invention are useful for treating and opecia, acme vulgaris, seboratose, and female hirsutism and prostatic and prostatic of hyperatrophy. The present sequence is the sense strand for one such siRNA of the invartion of the invartion of the siRNA of the invartion of the siRNA of the invartion of the siRNA of the invartion and female hirsutism and prostatic of hyperatrophy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                  Inhibitory nucleic acid that inhibits expression of an androgen signal transduction pathway protein useful for treating hair loss, comprises a double stranded RNA having a partial sequence encoding a pathway protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cyctoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the dysregulation of the telomerase repression pathway may cause reactivation or or upregulation of the telomerase expression in cancer. Substances, identified in the methods, can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These substances, e.g. antisense oligomucleotides, transcription factors, peptide nucleic acids and factors that disrupt signal transduction, are (especially poTG2-codAupp) comprising the promoter and a viral thymidine can be used to convert a producy, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter can allows the analysis of therapeutic molecules which modulate hTR promoter and activity sequences Ask707696-521 represent PCR primers used in cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAV41169
```

```
Sequences shown in AAV41169 to AAV41181 represent antisense
oligonuclectides to the RNA component of human telomerase (hTR). These
antisense oligonuclectides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
oligonuclectides may specifically be used for detection of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
oligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the half-
oligonucleotides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the half-
collent and providing progness of the telomerase activity inhibiting assembly of
the RNA component into the telomerase holoenzyme, or inhibiting telomerase of polymerase activity of telomerase of inhibiting telomerase of inhibitin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                         - used for detecting
                  New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mouse and human telomerase RNA gene promoters, useful for tumor specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR;

gene therapy

```
The invention relates to promoter regions from mouse and human telomerase

RNA (TR) component genes. The TR gene promoter can be linked to a

RNA (TR) component genes. The TR gene encoding a cytotoxin, for therapy of

cancer, especially neoplasias. The telomerase is necessary for the

currestricted proliferative capacity of many human cancers. Mutation or

- RNA segment of 10 to 100000 nucleotides (nt) that together are treplicated by RNA replicase; B and B = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound to (1). Replication of R3 by RNA replicase indicates presence of (1). Also described are: (1) method for detecting (1) using R1 and R2; (2) kit for this process containing R1, R2, ligase and an amplification system; DNA. R1 and R2 are used to detect and quantify telomerase, particularly provide an assay that does not require expensive of makey that does not require expensive or integrity browned; and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                  invention

RNA and New ribonucleic acids useful for identifying naturally occurring sequences having affinity for RNA-binding protein Example 2; Col 26; 36pp; English. components.

RNA

The specification describes a first RNA (RNA1) and a second RNA (RNA2) components. RNA1 has the formula 5'-A-B-C-3', where A is section having 10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RBP and which can bind to the protein component; C is section having about 1-20 nucleotides and which can be ligated to D of the second RNA molecule. RNA2 has the formula 5'-D-E-F-3', where D is section having 10 nucleotides and which can be ligated to C; E is section laving 1-20 nucleotides and which can be ligated to C; E is section 10-3,000 nucleotides which have affinity to second consensus sequence of the RBP

```
The present invention describes a pair of RNA molecules (R1, R2) for detecting a first subunit protein (I) of telomerase. R1 and R2 both bind to (I) and have formulae 5'-A-B-C-3' (R1) 5'-D-E-F-3' (R2) where: A and F = RNA segment of 10 to 10000 nucleotides (nr) that together are the x region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of RNA segments of 1 to 10000 nt which can be ligated together. Ligation of C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 8'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 8'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 8'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D 3' method for making R1 and R2 is ligase and an amplification system; and 3) method for making R1 and R2 by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2 trained personnel, and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                ö
and which can bind to the protein component; F is section having 10-100,000 nucleotides which can be received by an RNA replicase and with A being replicated. RNA1 and RNA2 are capable of forming a third RNA (RNA3) of formula 5'A-B-C-D-E-F-3'. The method is useful for the identification and characterization of RNA sequences having specific affinity to amino acid consensus sequences of RBPs, and to RNAs. AAH24815-16 were used to produce a double-stranded RNA1, comprising the Y-1 domain of human

RNA1 has the formula 5'-A-E-C-3', where A is section having 10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the BPP and which can bind to the protein component; C is section having about 1-20 nucleotides and which can be ligated to D of the second RNA molectides which have affinity to second consensus sequence of the RNA2 has the formula 5'-D-E-F-3', where D is section having 1-C on nucleotides which can be ligated to C; E is section 10-3,000 nucleotides which can be received by a RNA replicase and with A being replicated. RNA1 and RNA2 are capable of forming a third RNA feature S'A-B-C-D-E-F-3'. The method is useful for the identification and characterization of RNA sequences having specific affinity to amino and characterization of RNAs equences having specific affinity to amino produce a double-stranded RNA1, comprising the Y-1 domain of human
                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New ribonucleic acids useful for identifying naturally occurring RNA sequences having affinity for RNA-binding protein having protein and RNA

The invention comprises the amino acid and coding sequences of the human cholesteryl ester transfer protein (CETP), the invention also comprises polymorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific oligonucleotide PCR primer for the

The I; Cutaneous filarial nematode parasite of humans. The I constructed from third stage infective larvae of Onchocerca volvulus isolated from mosquitoes 10 days after infection and converted to double stranded cDNA using reverse transcriptase and oligo(dT) followed by RNase H and DNApol I. The library had 1.8 x 10E5 independent recombinants and average insert size was 900 base pairs. The library was constructed by Wenhong Lu. The library is available from Dr. S.A. Williams, email genome@smith.edu."

Patent No. 5958680
GENERAL INFORMATION:
APPLICANT: Villeponteau, Bryant
APPLICANT: Feng, Junii
APPLICANT: Andrews, William H.
TITLE OF INVENTION: Mammalian Telomerase
NUMBER OF SEQUENCES: 44

CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CLASSIFICATION: 4.5

Sequence 3, Application US/09717829A

Patent No. 6545133

GENERAL INFORMATION:
APPLICANT: Atkinson III, Edward M

APPLICANT: Atkinson III, Edward M

APPLICANT: Lichteteiner, Serge P

APPLICANT: Pruzan, Romald A

TITLE OF INVENTION: A Method for Purifying Telomerase
CURRENT PRICATION NUMBER: US/09/717,829A

CURRENT APPLICATION NUMBER: 09/420,056

PRIOR PILING DATE: 1999-10-18

PRIOR FILING DATE: 1999-10-18

PRIOR PILING DATE: 1999-10-18

PRIOR PILING DATE: 1995-04-04

PRIOR PILING DATE: 1995-04-04

SRIOR PILING DATE: 1995-08-04

NUMBER OF SEO ID NOS: 11

SOFTWARE: PatentIN Ver. 2.1 edited

Sequence 4, Application US/09633573

Patent No. 6607898

GENERAL INFORMATION:
APPLICANT: Kopreski, Michael S.
APPLICANT: Gocke, Christopher D.
TITLE OF INVENTION: Telomerase-associated RNA in Plasma or Serum
FILE REFERENCE: 00-1328

CURRENT APPLICATION NUMBER: US/09/653,573

CURRENT FILING DATE: 2000-08-31

PRIOR FILING DATE: 2000-08-31

PRIOR FILING DATE: 2000-08-31

NUMBER OF SEQ ID NOS: 7

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   APPLICANT: Kopreski, Michael S.
